Disc Storage Unit

ABSTRACT

5

A disc storage unit includes a case, a tray supported by
the case and configured to support an array of discs in
respective parallel vertical planes across which
respective coaxial axes of the discs pass horizontally.
10 There is a disc-raising mechanism having a finger
activatable to lift one of the discs from the tray within
its respective plane to thereby render that disc non-
coaxial with other discs that might be supported by the
tray. The storage unit also includes an indexing
15 mechanism that is configured to cause the disc-raising
mechanism to raise others of the discs in a like manner.
This enables labels of the raised discs to be viewed for
selection by a user.
